

Abdullah Saleh Robin

Senior Software Engineer

.NET/C# · React/Angular · AI-Augmented Development Workflows

Berlin, Germany | Open to relocation across Germany

Authorized to work in Germany (No sponsorship required)

+49 152 06964467 | abdullahsalehrobin@gmail.com | [LinkedIn](#) | [GitHub](#) | [Portfolio](#)

PROFESSIONAL SUMMARY

Senior Software Engineer with 9 years of professional experience building scalable enterprise applications across e-commerce, compliance, healthcare, and public-sector domains — collaborating with distributed, cross-timezone teams across the US and Canada. Specialized in cloud-native **.NET** and **Angular/React** architectures and AI-augmented engineering workflows. Based in Germany, available immediately, and authorized to work without sponsorship.

KEY ACHIEVEMENTS

- SpireWiz** — cut Optimizely Configured Commerce upgrade cycles by up to **80%** and reclaimed 600+ developer hours annually via AI-driven three-way merge automation.
- Smart Voter Info — scaled a self-built **.NET** / PostgreSQL platform to **177M+** processed entries and ~10M searches during a 15-day national-election window.
- Led 8–10 engineers across national healthcare, telemedicine, and government platforms serving 30M+ residents.

TECHNICAL SKILLS

Programming Languages	C#, TypeScript, JavaScript, SQL
.NET & Backend	.NET, ASP.NET Core, Entity Framework Core, REST APIs
Architecture & Patterns	Microservices, Event-Driven Architecture, Clean Architecture
Frontend	React, Angular, TypeScript, RxJS
Node.js	Node.js, Express
Security & Auth	JWT, RBAC, 2FA
Databases & Caching	SQL Server, PostgreSQL, Redis
Cloud Platforms	Azure, AWS
Cloud-Native & DevOps	Docker, Kubernetes, CI/CD, Git
APIs & Messaging	REST APIs, OpenAPI / Swagger, HTTP, RabbitMQ
AI & LLM API Integration	OpenAI Platform API, Google Gemini API, RAG
AI-Assisted Development	Claude Code, Cursor IDE, GitHub Copilot
Document Processing & OCR	Google Cloud Vision OCR, PDF.js
Platforms & Products	Optimizely Configured Commerce, Sitecore
Testing	TDD, NUnit, xUnit, Playwright
Methodologies	Agile (Scrum, Kanban), Jira

PROFESSIONAL EXPERIENCE

Senior Developer | Optimizely

May 2023 – June 2026

Global B2B Commerce SaaS | US & Canada teams

Technologies: .NET, SQL Server, Angular, React, Webpack, OpenAI Platform API / GPT-4o, Claude Code, GitHub Copilot

- Proactively identified process inefficiencies and co-engineered **SpireWiz**, an AI-powered upgrade automation tool, integrating the **OpenAI** Platform API into three-way merge analysis workflows to detect and resolve complex code conflicts; automated 25+ annual upgrades, reducing effort by ~**80%**, reclaiming 600+ developer hours annually, and contributing an estimated USD 180K in annual business impact.
- Embedded AI-augmented SDLC workflows using Claude Code agents/commands, Cursor, GitHub Copilot, and MCP-based tools to accelerate codebase analysis, refactoring, migration, and delivery across enterprise B2B Commerce projects; reduced one custom DLL-to-extension migration from a 200-hour estimate to 90 hours while maintaining human-reviewed production code quality.
- Customized and maintained enterprise B2B commerce solutions for international clients, delivering platform enhancements, bug fixes, integrations, and performance improvements across complex production environments.
- Executed two major enterprise system migrations, accelerating delivery timelines 55% versus historical team averages through optimized internal processes and deployment workflows.
- Pioneered the platform's first Classic (**Angular**) → Spire (**React**) storefront migrations on Optimizely Configured Commerce — shipped on schedule and codified a reusable migration playbook the team now applies to client upgrades.

- Chosen for cross-team work on Optimizely Opal, the company's AI platform — developed a custom Opal tool that exposes Configured Commerce order history and built a proof-of-concept Opal–Sitecore integration.
- Drove engineering quality by upholding a mandatory pull-request review process and personally reviewing 100+ PRs across 15+ B2B client projects — mentoring developers, cutting deployment errors, and spreading knowledge across teams.

Senior Software Engineer | Orion Informatics

May 2022 – April 2023

Custom Software Development | US teams

Technologies: .NET, SignalR, Socket.IO, Azure Table Storage, MSSQL, Docker, Angular

- Developed real-time communication features for a digital asset platform using **.NET**, SignalR, and Socket.IO to support persistent client-server connectivity.
- Implemented connection management workflows to handle lost connections, reconnections, and edge-case scenarios in real-time user interactions.
- Integrated backend services with **Azure** Table Storage and MSSQL while supporting containerized development and deployment using Docker.

Senior Programmer | Synesis IT

September 2017 – April 2022

Healthcare Software Development Company

Technologies: .NET, Spring Boot, Node.js, gRPC, Protobuf, Angular, RabbitMQ, Redis, Docker, MySQL, Nginx, Rasa NLP

- Progressed into a Senior Programmer / Team Lead role, leading 8–10 engineers across national government, healthcare, and telemedicine platforms.
- Architected a modular, service-based backend for a national skills-certification platform used by 100,000+ providers, assessment centers, and workers — with access control, two-factor authentication (2FA), and payment-gateway integration.
- Built the **Angular** interface for a national skills-certification platform serving 100,000+ providers — secure 2FA payment journeys and dynamic certificate generation for applications and assessments.
- Engineered REST APIs for a countrywide telemedicine contact center — architected for scalability and redundancy to serve 30M+ rural residents and handle 100,000+ teleconference calls.
- Developed the **Angular** front-end for a countrywide telemedicine platform serving 30M+ rural residents — a teleconference-based remote-diagnosis UI built to handle 100,000+ patient consultations.
- Designed a runtime questionnaire builder in **Angular** for a COVID-19 telehealth CRM — operators add, edit, and reorder patient-intake questions on the fly — supporting care for 10,000+ patients daily during the pandemic.
- Delivered a conversational commerce bot on Facebook Messenger with Rasa NLP — in-chat product discovery and checkout for 800+ concurrent users.
- Reduced report-generation query latency ~70% through targeted database indexing.

PROJECTS

Smart Voter Info

2016 – January 2026

Election-data processing platform for 340+ client organisations, Bangladesh | in production 2021 – January 2026

Technologies: .NET, ASP.NET Core, PostgreSQL, RabbitMQ, OpenAI Platform API, Gemini API, Google Cloud Vision, Kubernetes; Angular, TypeScript, RxJS, Angular Material, IndexedDB (Dexie), Web Crypto (HMAC), PDF.js, OpenCV.js, Syncfusion, ExcelJS, fflate

- Sole architect, engineer, and operator of a production platform evolved since 2016 from a Java desktop tool to a **.NET** WPF rewrite and finally a **.NET** cloud-native system with APIs, background workers, **Angular** frontends, and PostgreSQL.
- Scaled the platform, in production since 2021, to process 230,000+ scanned PDFs and **177M+** processed voter entries for 340+ clients, backed by a 65M-record PostgreSQL database and a 126,000-document surge in a single election quarter.
- Architected a provider-agnostic LLM API integration layer using the **OpenAI** Platform API and Google Gemini API, with schema-constrained JSON output, token budgeting, content-hash caching, concurrent batch processing, and exponential-backoff retries.
- Engineered a multi-threaded PDF/OCR and document-delivery workflow using Ghostscript, Google Cloud Vision, SHA-256 OCR caching, OpenCV-assisted table extraction, RabbitMQ/MediatR orchestration, and Google Drive sharing; reduced batch processing time from 40 minutes to 5 minutes.
- Deployed the public API as a cloud-native **.NET** service on **Kubernetes** using Docker, Kustomize, HPA autoscaling, TLS ingress, rate limiting, and ArgoCD GitOps, serving ~10M voter searches during a 15-day national-election window.
- Built and maintained two production **Angular** SPAs — an offline-first public app and an admin/data-entry suite spanning 130+ components, 75+ services, and 20 lazy-loaded modules — deliberately offloading heavy compute to the browser to keep the backend a thin store-and-serve layer.
- Engineered a fully client-side document-processing pipeline in **Angular** — extracting structured voter records off the PDF text layer with PDF.js in a Web Worker (two-pass serial localization, multiple pattern matchers with multi-level fallbacks, Bengali↔ASCII numeral handling) and running ZIP read/clean/repackage, blank-page removal, and gzip compression before upload — parsing up to ~500,000 records in ~2 minutes so the backend only validates and stores.
- Developed an AI-assisted data-entry workspace consuming Google Cloud Vision OCR with in-browser OpenCV.js table detection and a 3-stage AI cleanup, plus operator undo/redo — auto-filling ~95% of fields and cutting unstructured-PDF data entry from ~3 hours to ~20 minutes (~89% faster).

- Engineered an offline-first voter-search app (**Angular** standalone components) on IndexedDB/Dexie with compound indexes and cursor-based pagination — making ~500,000 voters fully searchable offline over fflate-compressed datasets — plus batched client-side activity telemetry with device and GPS capture.
- Delivered a per-client public lookup with runtime white-label theming via CSS custom properties and a 3-tier image cache (memory → fflate-compressed localStorage → CDN/proxy, LRU + blob-URL cleanup) reaching a ~95% cache hit-rate and cutting repeat-view bandwidth ~90%; access gated by a signed token with server-driven HTML templates rendered through **Angular's** DomSanitizer.
- Implemented frontend access control with HMAC-SHA256 request signing in a custom HTTP interceptor (Web Crypto — method, path, body-hash, timestamp, and nonce for replay and tamper resistance) plus permission-based route guards with role tiers and JWT-driven dynamic navigation.
- Built the platform's printing stack entirely in the browser — a Syncfusion print-layout generator (PDF↔canvas coordinate transforms, multi-form-per-page) that composes print-ready voter-slip forms with no server rendering, plus field thermal/POS printing that captures a slip via html-to-image and drives a Bluetooth printer through the RawBT protocol (Android-print and Web Share fallbacks).

EDUCATION

B.Sc. in Computer Science & Engineering

2014 – 2017

American International University-Bangladesh — CGPA: 3.41 out of 4.00 | Dhaka, Bangladesh

CERTIFICATIONS

- **Microsoft Certified: Azure Fundamentals (AZ-900)** — Credential ID: 2355E1550D085480 [Certificate Link](#)
- **Optimizely Opal Tools Certified 2025** — Credential ID: 85936b8a-0f2f-44d2-b3b1-12e55f63158d [Certificate Link](#)
